

---

The following document contains information on Cypress products. Although the document is marked with the name "Spansion" and "Fujitsu", the company that originally developed the specification, Cypress will continue to offer these products to new and existing customers.

#### **Continuity of Specifications**

There is no change to this document as a result of offering the device as a Cypress product. Any changes that have been made are the result of normal document improvements and are noted in the document history page, where supported. Future revisions will occur when appropriate, and changes will be noted in a document history page.

#### **Continuity of Ordering Part Numbers**

Cypress continues to support existing part numbers. To order these products, please use only the Ordering Part Numbers listed in this document.

#### **For More Information**

Please contact your local sales office for additional information about Cypress products and solutions.

#### **About Cypress**

Cypress (NASDAQ: CY) delivers high-performance, high-quality solutions at the heart of today's most advanced embedded systems, from automotive, industrial and networking platforms to highly interactive consumer and mobile devices. With a broad, differentiated product portfolio that includes NOR flash memories, F-RAM™ and SRAM, Traveo™ microcontrollers, the industry's only PSoC® programmable system-on-chip solutions, analog and PMIC Power Management ICs, CapSense® capacitive touch-sensing controllers, and Wireless BLE Bluetooth® Low-Energy and USB connectivity solutions, Cypress is committed to providing its customers worldwide with consistent innovation, best-in-class support and exceptional system value.

## 32-bit Microcontrollers

CMOS

# FR80 MB91635A Series

## MB91637A/F635A/F637A/F639A/V650

### ■ DESCRIPTION

The MB91635A series is a line of Fujitsu Semiconductor microcontrollers based on a 32-bit RISC CPU core that feature a variety of peripheral functions for embedded applications that demand high-performance and high-speed CPU processing.

This series is based on the FR80\* family CPU and is implemented as a single chip.

\* : FR, the abbreviation of FUJITSU RISC controller, is a line of products of Fujitsu Semiconductor Limited.

### ■ FEATURES

- FR80 CPU
  - 32-bit RISC, load/store architecture, five-stage pipeline
  - General-purpose registers : 32-bit × 16
  - 16-bit fixed-length instructions (basic instructions) : 1 instruction per cycle
  - Instructions suitable for embedded applications
    - Memory-to-memory transfer, bit processing, barrel shift instructions, etc.
    - Instruction support for high level languages
      - Function entry and exit instructions, instructions for register multi-load and multi-store
    - Bit search instruction
      - “1” detection, “0” detection, transition point detection
    - Branch instructions with delay slots
      - Reduced overhead when processing branches
    - Register interlock functions
      - Facilitate coding in assembly language
    - Built-in multiplier/instruction-level support
      - Signed 32-bit multiplication : 5 cycles
      - Signed 16-bit multiplication : 3 cycles

(Continued)

For the information for microcontroller supports, see the following web site.

This web site includes the "**Customer Design Review Supplement**" which provides the latest cautions on system development and the minimal requirements to be checked to prevent problems before the system development.

<http://edevice.fujitsu.com/micom/en-support/>

# MB91635A Series

- Interrupts (save PC and PS) : 6 cycles, 16 priority levels
- Harvard architecture allowing program access and data access to be executed simultaneously
- Instruction prefetch function has been added with 4 word instruction queue of CPU
- Instruction compatible with FR family CPU
  - Additional bit search instructions
  - No resource instructions and coprocessor instructions
- Maximum operating frequency
  - CPU : 60 MHz
  - Resources : 40 MHz
  - External bus : 40 MHz

Note: The PLL clock specification of MB91635A series

In MB91635A series, PLL clock specification has been modified from MB91635 series. The setting of dividing by 1 of PLL macro oscillation clock divide configuration value is prohibited.

Therefore, please use the device with setting as dividing by 2 to 4 by ODS0 or ODS1 bit in the PLL configuration register (PLLCR). For more details, refer to “4.4.4 PLL Configuration Register (PLLCR)” in the “Hardware Manual”.

- External bus interface
  - Operating frequency : Max 40 MHz
  - 24 address lines, 8- or 16-bit data I/O (separate busses or multiplexed bus)
  - Chip select output available for 4 independent programmable areas
    - Programmable automatic wait cycle insertion for each area
- DMA controller (DMAC)
  - 8 channels
  - Address space : 32 bits (4 Gbytes)
  - Transfer modes : Block transfer/burst transfer/demand transfer
  - Address update : Increment/decrement/fixed (increment/decrement step size of 1, 2, or 4)
  - Transfer data length : Selectable from 8-bit, 16-bit, 32-bit
  - Block size : 1 to 16
  - Number of transfers : 1 to 65535
  - Transfer requests
    - Requests from software
    - Interrupt requests from peripheral resources (interrupt requests are shared, including external interrupts)
    - Requests from external pins
  - Reload functions : Reload can be specified on all channels
  - Priority order : Fixed (ch.0 > ch.1 > ch.2 > ch.3 > ...) or round-robin
  - Interrupt requests : Interrupts can be generated for transfer complete, transfer error, and transfer interrupted.

(Continued)

- Multifunction serial interface
  - 4 channels with 16-byte FIFO, 8 channels without FIFO
  - Operation mode is selectable from the followings for each channel (For ch.0, I<sup>2</sup>C is not available.)
    - UART
      - Full-duplex double buffer
      - Selectable parity on/off
      - Built-in dedicated baud rate generator
      - External clock can be used as a serial clock
      - Error detection function for parity, frame and overrun errors
    - CSIO
      - Full-duplex double buffer
      - Built-in dedicated baud rate generator
      - Overrun error detection function
    - I<sup>2</sup>C
      - Supports both standard mode (Max 100 kbps) and Fast mode (Max 400 kbps)
      - Some channels are 5 V tolerant
- Interrupts
  - Total of 32 external interrupts (some pins are 5 V tolerant)
  - Interrupts from peripheral resources
  - Programmable interrupt levels (16 levels)
  - Can be used to return from stop mode, sleep mode
- A/D converter
  - 31 channels, 2 units
  - 10-bit resolution
  - Conversion time : approx. 1.2  $\mu$ s (PCLK = 33 MHz)
  - Priority conversion (2 levels)
  - Conversion modes : Single-shot conversion mode, scan conversion mode
  - Activation sources : Software, external trigger, base timer
  - Built-in FIFO for storing conversion data (for scan conversion:16, for priority conversion:4)
- D/A converter
  - 3 channels
  - 8-bit resolution
- Base timer
  - 16 channels
  - Operation mode is selectable from the followings for each channel
    - 16/32-bit reload timer
    - 16-bit PWM timer
    - 16/32-bit PWC timer
    - 16-bit PPG timer
  - Cascading connection between 2 channels allows them to be used as one 32-bit timer
  - Multiple channels can be started simultaneously
  - Input/output select function

(Continued)

# MB91635A Series

(Continued)

- 16-bit reload timer
  - 3 channels (including 1 channel for REALOS)
  - Interval timer function
  - Count clock select function (peripheral clock (PCLK) divided by 2 to 64)
- Compare timer
  - 32-bit input capture : 8 channels
  - 32-bit output compare : 8 channels
  - 32-bit free-run timer : 2 channels
- Other interval timers
  - Up/down counter : 4 channels
  - Watch counter : 1 channel
  - Watchdog timer : 1 channel
- Main timer
  - 1 channel
  - Counts the oscillation stabilization wait time of the main clock (MCLK)
  - Counts the oscillation stabilization wait time of the PLL clock (PLLCLK)
  - Can be used as an interval timer while the main clock (MCLK) oscillations is stable
- Sub timer
  - 1 channel
  - Counts the oscillation stabilization wait time of the sub clock (SBCLK)
  - Can be used as an interval timer while the sub clock (SBCLK) oscillations is stable
- Clock generation
  - Main clock (MCLK) oscillator
  - Sub clock (SBCLK) oscillator
  - PLL clock (PLLCLK) oscillator
- Low-power dissipation mode
  - Stop mode
  - Watch mode
  - Sleep mode
  - Doze mode
  - Clock division function
- Other features
  - I/O port
  - INIT pin is provided as a reset pin
  - Watchdog timer reset, software reset
  - Delay interrupt
  - Power supply : Single power supply (2.7 V to 3.6 V)

# MB91635A Series

## ■ PRODUCT LINEUP

Product Name Items	MB91V650	MB91F639A	MB91F637A	MB91F635A	MB91637A
Product type	Evaluation product	Flash memory product			MASK ROM product
Built-in program memory capacity	(Support by emulation memory)	1 M byte (Flash)	512 K bytes (Flash)	256 K bytes (Flash)	512 K bytes (ROM)
Built-in RAM capacity	128 K bytes	64 K bytes	48 K bytes	32 K bytes	48 K bytes
External bus interface		Yes			
DMA controller (DMAC)		8 channels			
Base timer		16 channels			
Multifunction serial interface		Without FIFO : 8 channels (ch.0 to ch.7) With FIFO : 4 channels (ch.8 to ch.11)			
External interrupt		32 (some pins are 5 V tolerant)			
10-bit A/D converter	32 channels, 2 units	31 channels, 2 units			
8-bit D/A converter		3 channels			
16-bit reload timer		3 channels			
32-bit input capture		8 channels			
32-bit output compare		8 channels			
32-bit free-run timer		2 channels			
Up/Down counter		4 channels			
Watch counter		1 channel			
I/O port	154	126			
Main timer		1 channel			
Sub timer		1 channel			
Wild register		16 channels			
Debug function	DSU4	—			

## ■ PACKAGES

## ■ PIN ASSIGNMENT

LQFP-144

(TOP VIEW)

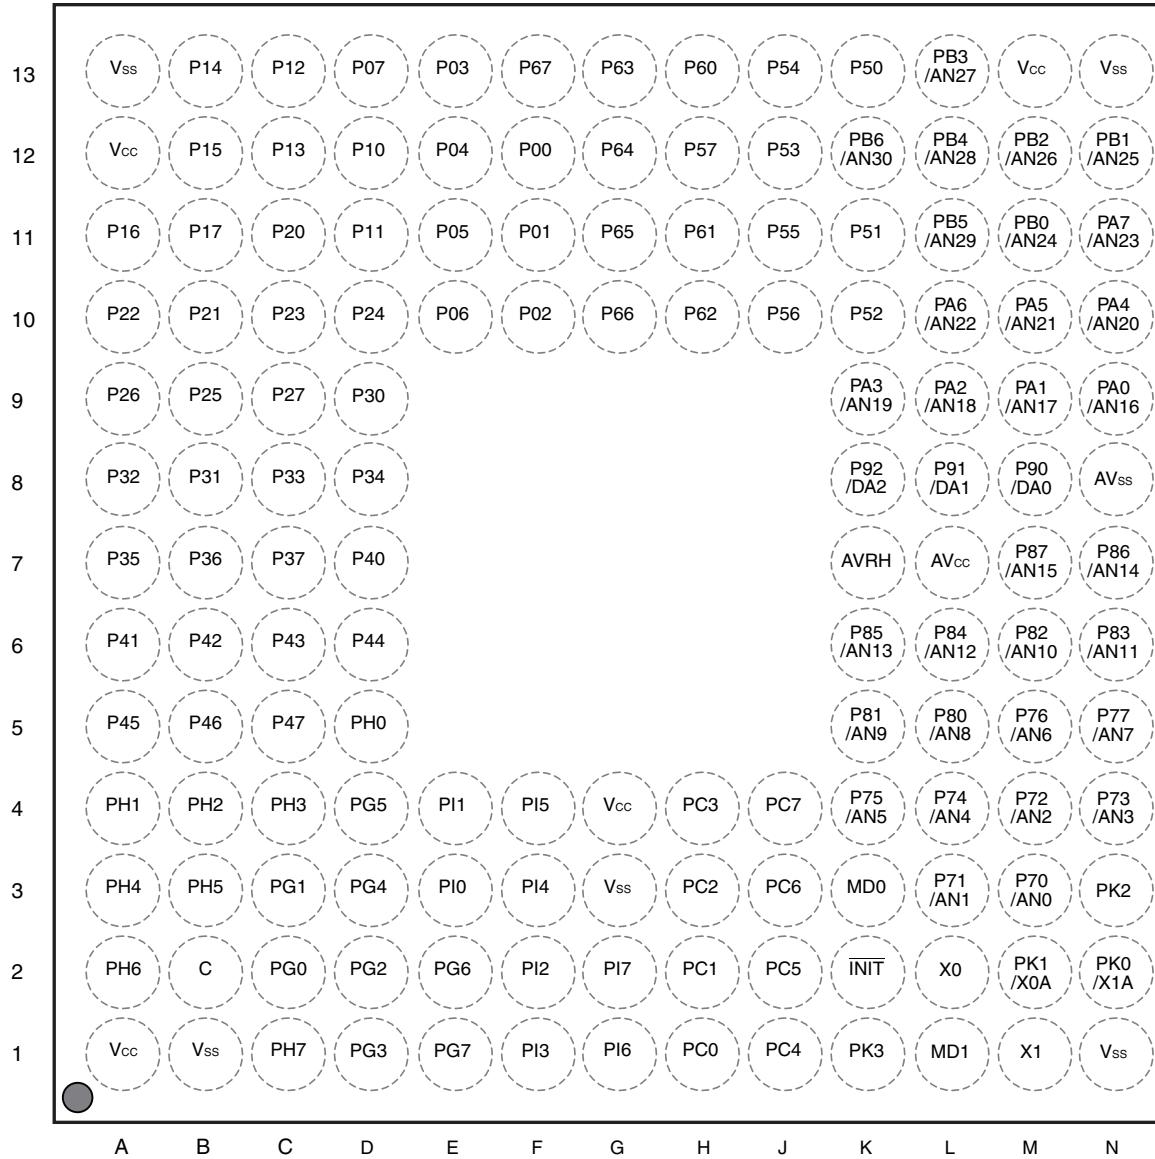

(FPT-144P-M08)

Note: The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

# MB91635A Series

PFBGA-144

(TOP VIEW)

(BGA-144P-M06)

Note: Due to the space limitation, the pin assignment for the PFBGA-144 only shows representative names for each of the pins such as port names. Refer to "PIN DESCRIPTION" for the pin names.

# MB91635A Series

## ■ PIN DESCRIPTION

The number after the underscore (“\_”) in pin names such as XXX\_1 and XXX\_2 indicates the port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

## ■ PRECAUTIONS FOR HANDLING THE DEVICES

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your FUJITSU SEMICONDUCTOR semiconductor devices.

### 1. Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

- Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

- Recommended Operating Conditions

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

- Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

#### (1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

#### (2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.

#### (3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

- Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNPN junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

Note: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (a) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
- (b) Be sure that abnormal current flows do not occur during the power-on sequence.

- Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

- Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

- Precautions Related to Usage of Devices

FUJITSU SEMICONDUCTOR semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU SEMICONDUCTOR sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

# MB91635A Series

## 2. Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under FUJITSU SEMICONDUCTOR's recommended conditions. For detailed information about mount conditions, contact your sales representative.

- Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder.

In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

- Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. FUJITSU SEMICONDUCTOR recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with FUJITSU SEMICONDUCTOR ranking of recommended conditions.

- Lead-Free Packaging

Note: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

- Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (a) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
- (b) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between +5 °C and +30 °C. When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- (c) When necessary, FUJITSU SEMICONDUCTOR packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (d) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

- Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the FUJITSU SEMICONDUCTOR recommended conditions for baking.

Condition: +125 °C / 24 h

- Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
- Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ). Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- Ground all fixtures and instruments, or protect with anti-static measures.
- Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

### 3. Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above. For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

Note: Plastic molded devices are flammable, and therefore should not be used near combustible substances.

If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of FUJITSU SEMICONDUCTOR products in other special environmental conditions should consult with sales representatives.

# MB91635A Series

## ■ HANDLING DEVICES

- Power supply pins

In products with multiple  $V_{CC}$  and  $V_{SS}$  pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. However, all of these pins should be connected externally to the power supply or ground lines in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating. Moreover, connect the current supply source with the  $V_{CC}$  and  $V_{SS}$  pins of this device at low impedance. It is also advisable that a ceramic capacitor of approximately  $0.1 \mu F$  be connected as a bypass capacitor between  $V_{CC}$  and  $V_{SS}$  pins near this device.

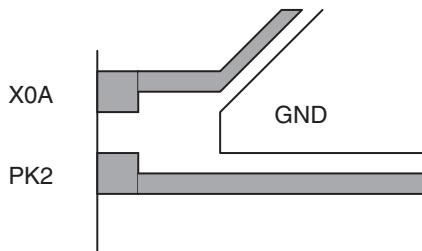

- Crystal oscillator circuit

Noise near the X0 and X1 pins may cause the device to malfunction. Design the printed circuit board so that X0, X1, the crystal oscillator (or ceramic oscillator), and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0 and X1 pins are surrounded by ground plane as this is expected to produce stable operation.

If a 32 kHz oscillator is used (X0A, X1A), use the PK2 pin for an input that changes as infrequently as possible. Furthermore, take steps such as shown in the following figure to prevent the X0A and PK2 wiring from running parallel to each other.

If 32 kHz oscillation is not used, there are no limitations.

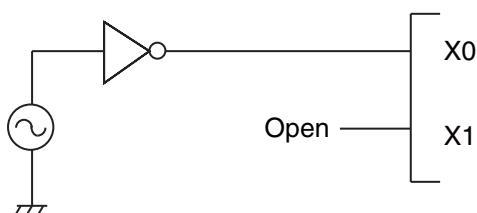

- Using an external clock

When using an external clock, the clock signal should be input to the X0 pin only and the X1 should be kept open.

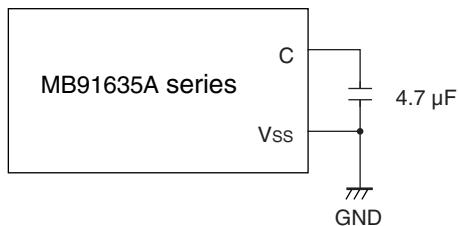

- Example of Using an External Clock

MB91635A series

- C Pin

As MB91635A series includes an internal regulator, always connect a bypass capacitor of approximately  $4.7\ \mu F$  to the C pin for use by the regulator.

- Mode pins (MD0, MD1)

Connect the MD pin (MD0, MD1) directly to V<sub>cc</sub> or V<sub>ss</sub> pins. Design the printed circuit board such that the pull-up/down resistance stays low, as well as the distance between the mode pins and V<sub>cc</sub> pins or V<sub>ss</sub> pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

- Notes on power-on

- To ensure that the internal regulator and the oscillator have stabilized immediately after the power is turned on, keep an "L" level input connected to the  $\overline{INIT}$  pin for the duration of the regulator voltage stabilization wait time + the oscillator start time of the oscillator + the main oscillator stabilization wait time.
- Turn power on/off in the following order
  - Turning on : V<sub>cc</sub> → AV<sub>cc</sub> → AVR<sub>H</sub>
  - Turning off : AVR<sub>H</sub> → AV<sub>cc</sub> → V<sub>cc</sub>

Release the reset ( $\overline{INIT}$  pin "L" level to "H" level) after the power supply has stabilized.

# MB91635A Series

- Caution on Operations during PLL Clock Mode

On this microcontroller, if in case the crystal oscillator breaks off or an external reference clock input stops while the PLL clock mode is selected, a self-oscillator circuit contained in the PLL may continue its operation at its self-running frequency.

However, Fujitsu Semiconductor will not guarantee results of operations if such failure occurs.

Note: Changes of PLL clock specification from MB91635 series

Product type	PLL macro oscillation clock frequency	Temperature range	PLL macro oscillation clock divider	PLL multiple rate
MB91F637/ MB91F639	16 MHz to 60 MHz	– 20 °C to + 85 °C	Divided by 1 to 4	Multiplied by 15
	50 MHz to 60 MHz	– 40 °C to + 85 °C		
MB91637A/ MB91F635A/ MB91F637A/ MB91F639A	80 MHz to 120 MHz	– 40 °C to + 85 °C	Divided by 2 to 4	Multiplied by 30

MB91635A series has been modified, and specifications of the PLL macro oscillation clock frequency, temperature range, PLL macro oscillation clock division value, and PLL multiple rate prohibit the setting of dividing by 1.

Therefore, please use the device with setting as dividing by 2 to 4 by ODS0 or ODS1 bit in the PLL configuration register (PLLCR).

Example) To use the PLL clock at 60MHz

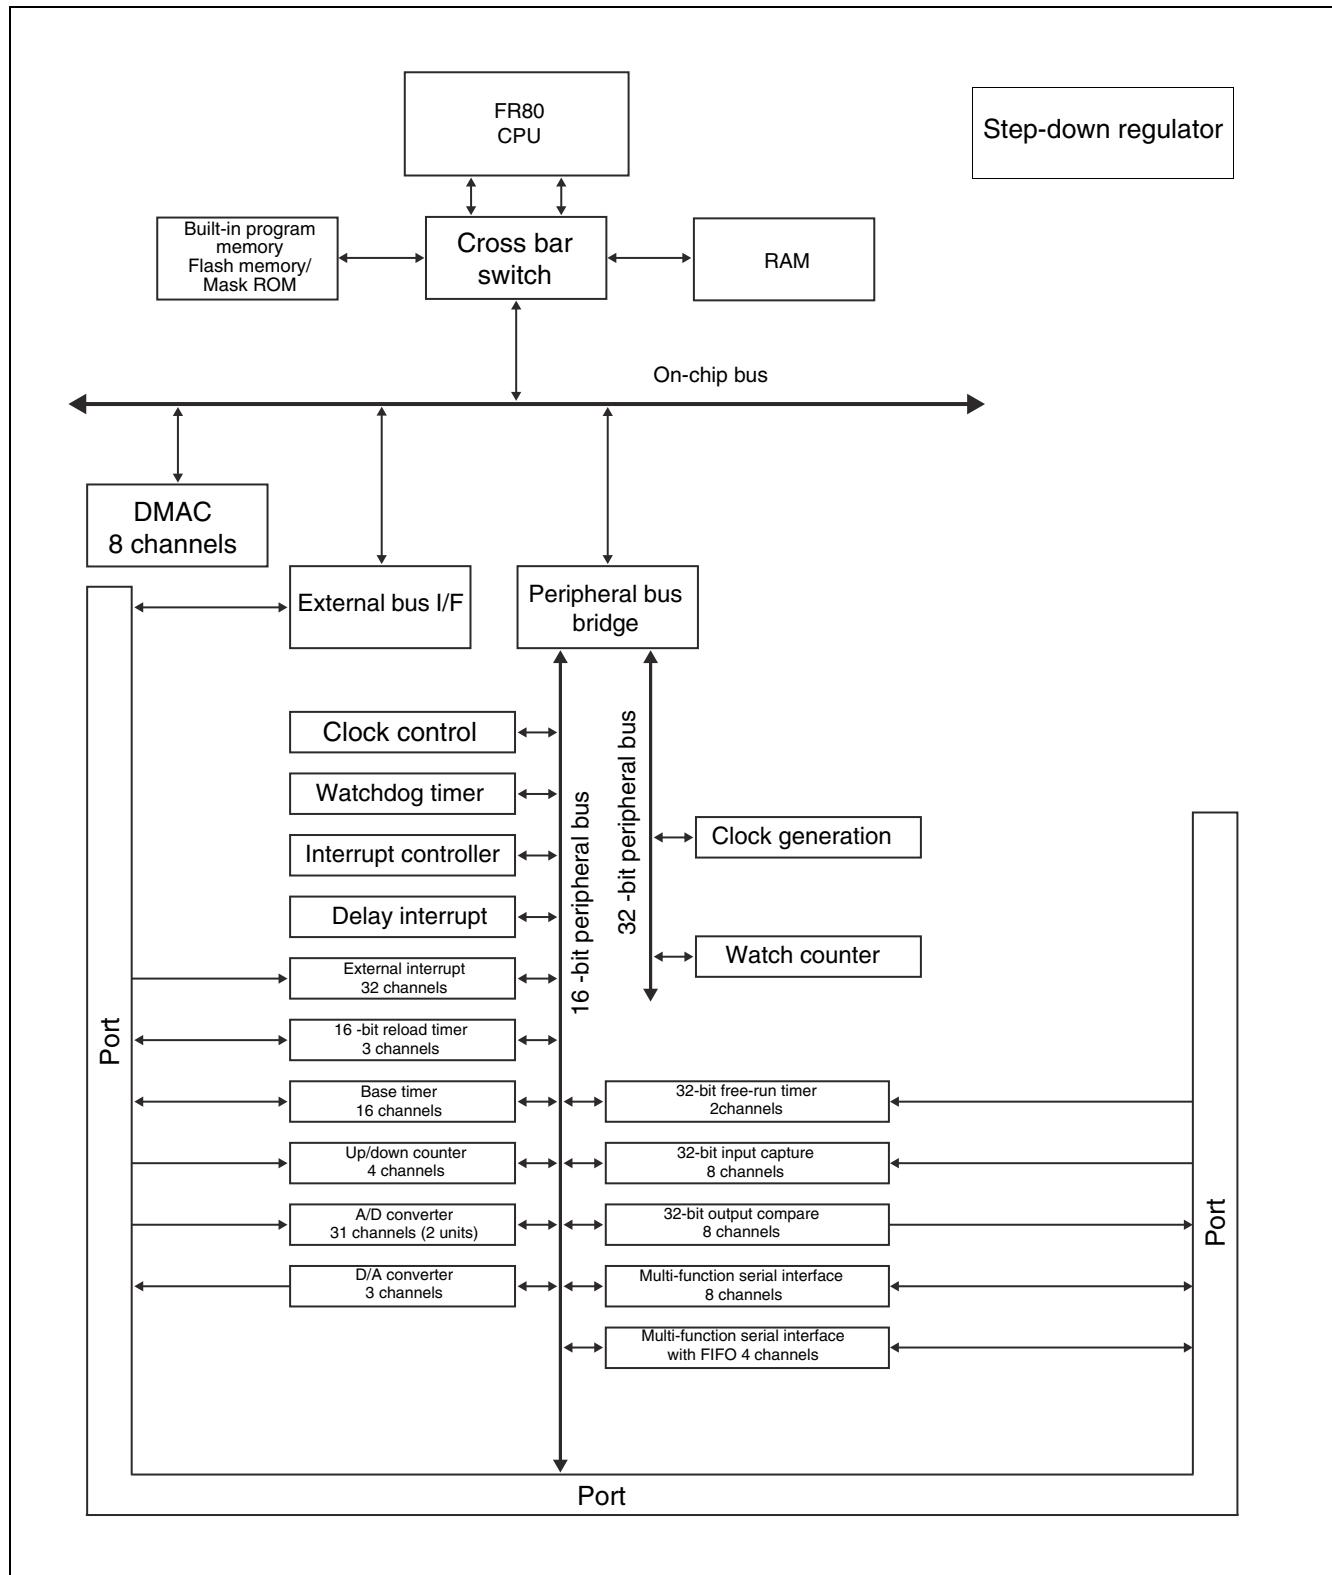

Product type	PLL input clock frequency	PDS	ODS	PMS	PLL macro oscillation clock frequency
MB91F637/ MB91F639	4 MHz	0000	00	1110	60 MHz
MB91637A/ MB91F635A/ MB91F637A/ MB91F639A	4 MHz	0000	01	1110	120 MHz

- Differences in features among the products with different memory sizes and between Flash products and MASK products

The electric characteristics including power consumption, ESD, latch-up, noise characteristics, and oscillation characteristics among the products with different memory sizes and between Flash products and MASK products are different because chip layout and memory structures are different.

If you are switching to use a different product of the same series, please make sure to evaluate the electric characteristics.

## ■ BLOCK DIAGRAM

# MB91635A Series

## ■ MEMORY SPACE

### 1. Memory Space

The FR family has 4 Gbytes of logical address space ( $2^{32}$  addresses) available to the CPU by linear access.

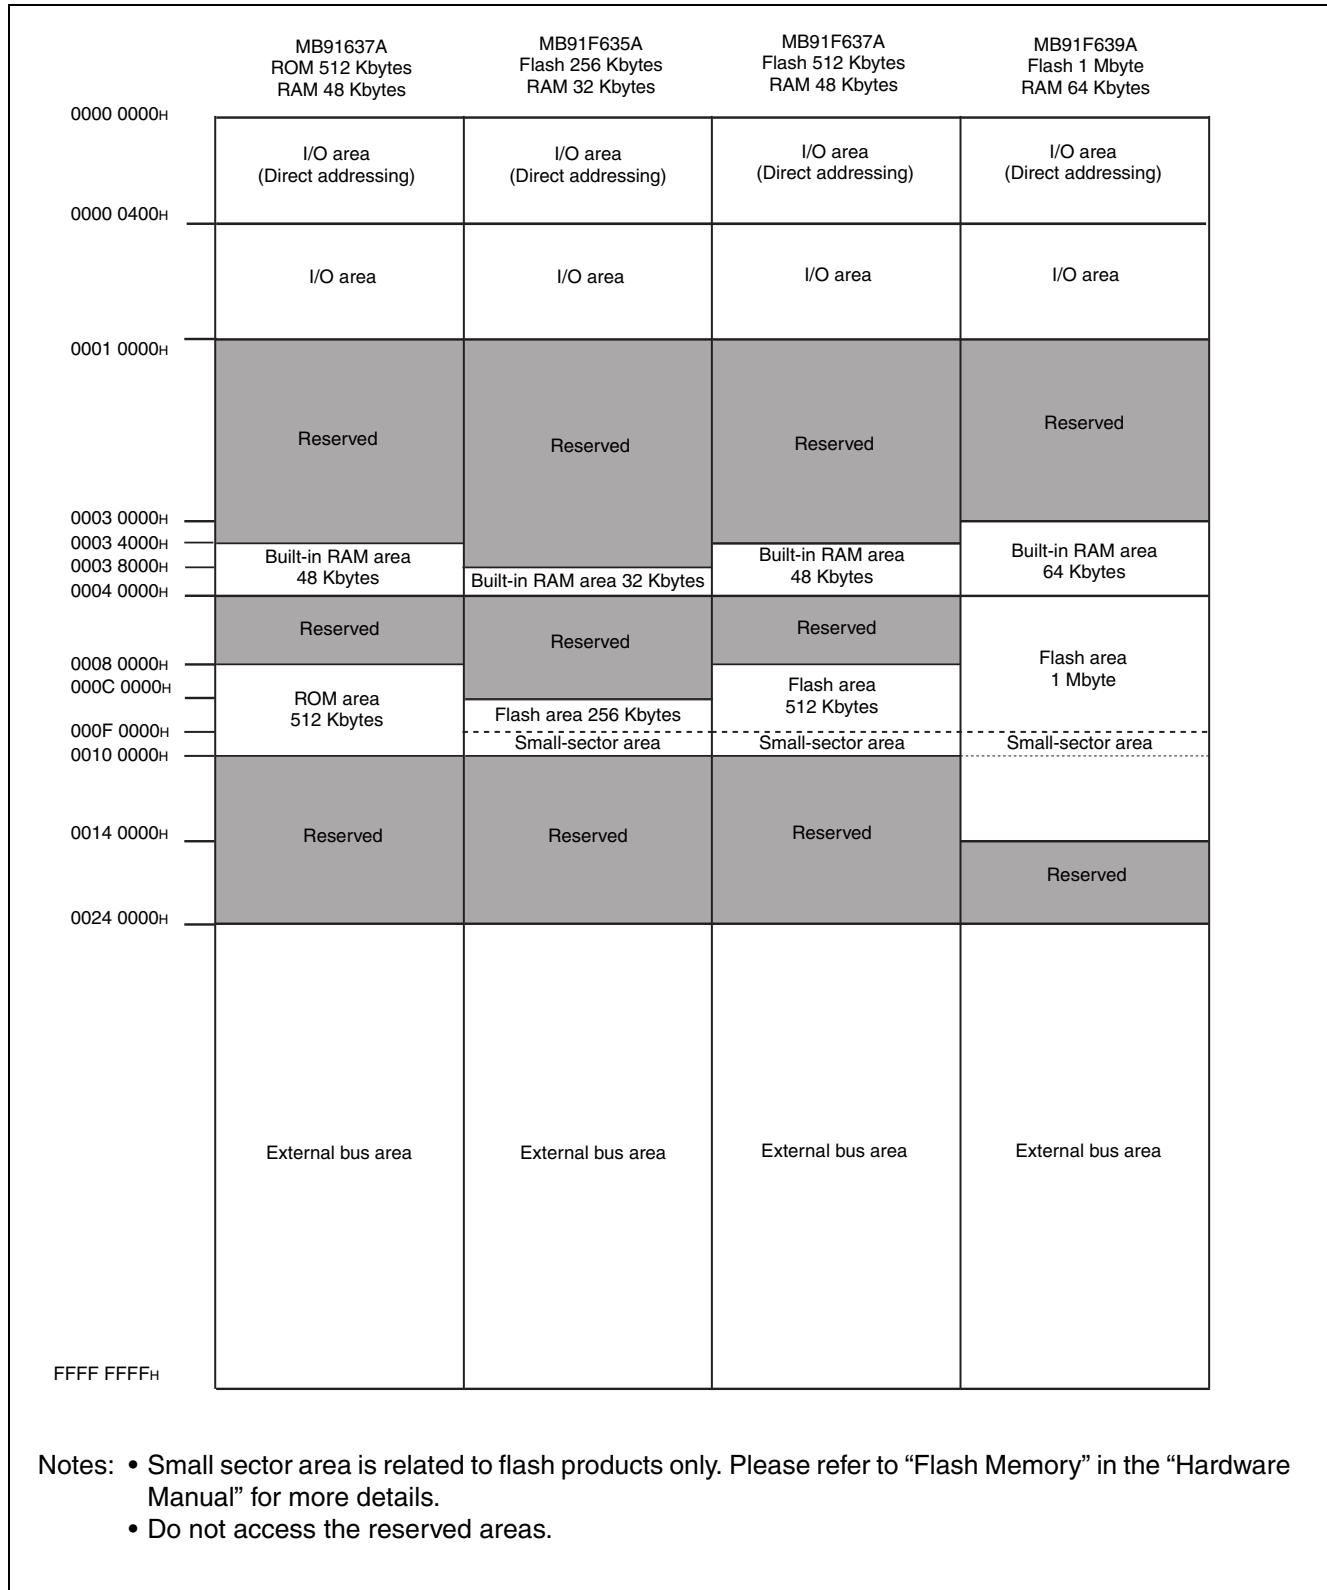

#### • Direct Addressing Areas

The following areas in the address space are used as I/O areas.

These areas are called direct addressing areas, and the address of an operand in these areas can be specified directly within an instruction. The size of the directly addressable area depends on the length of the data being accessed as follows.

- Byte data access : 0000 0000<sub>H</sub> to 0000 00FF<sub>H</sub>
- Half word data access : 0000 0000<sub>H</sub> to 0000 01FF<sub>H</sub>
- Word data access : 0000 0000<sub>H</sub> to 0000 03FF<sub>H</sub>

## 2. Memory Map

## ■ I/O MAP

[How to read the table]

Address	Register				Block
	+ 0	+ 1	+ 2	+ 3	
0000 0000 <sub>H</sub>	PDR0 [R/W] B, H XXXXXXXX	PDR1 [R/W] B, H XXXXXXXX	PDR2 [R/W] B, H XXXXXXXXXXXX	PDR3 [R/W] B, H XXXXXXXX	Port data register
0000 003C <sub>H</sub>	WDTCR0 [R/W] B, H -0--0000	WDTCPRO [R/W] B, H 00000000			Watchdog timer
0000 0040 <sub>H</sub>	EIRRO [R/W] B, H, W 00000000	ENIRO [R/W] B, H, W 00000000		ELVR0 [R/W] B, H, W 00000000 00000000	External interrupt 0 to 7

Initial value after reset  
 “1” : Initial value“1”  
 “0” : Initial value“0”  
 “X” : Initial value undefined  
 “-” : Reserved bit or undefined bit  
 Access unit  
 (B : byte, H : half word, W : word)  
 Read/write attribute  
 “R” : Indicates that there is a read only bit.  
 “R/W” : Indicates that there is a read/write bit.  
 “W” : Indicates that there is a write only bit.  
 Register name (column 1 of the register is at address 4n, column 2 is at address 4 n + 2...)  
 Leftmost register address (For word-length access, column 1 of the register is the MSB of the data.)

— : Reserved area

Notes:

- When performing a data access, the addresses should be as below.

- Word access : Address should be multiples of 4 (least significant 2 bits should be "00<sub>B</sub>")
- Half word access : Address should be multiples of 2 (least significant bit should be "0<sub>B</sub>")
- Byte access : —
- Do not access the reserved areas.

## ■ PIN STATUS IN EACH CPU STATE

The terms used for pin status have the following meanings.

- When  $\overline{\text{INIT}} = \text{L}$

This is the period when the  $\overline{\text{INIT}}$  pin is the “L” level.

- When  $\overline{\text{INIT}} = \text{H}$

The status immediately after the  $\overline{\text{INIT}}$  pin changes from the “L” level to the “H” level.

- SLVL1

This bit is a standby level setting bit in the standby mode control register (STBCR).

- Input enabled

Indicates that the input function can be used.

- Input disabled

Indicates that the input function cannot be used.

- Output Hi-Z

Indicates that the output drive transistor is disabled and the pin is put in the Hi-Z state.

- Maintain previous state

Maintains the state that was being output immediately prior to entering the current mode.

If a built-in peripheral function is operating, the output follows the peripheral function.

If the pin is being used as a port, that output is maintained.

- Internal input fixed at “0”

The input gate connected to the pin is disconnected from the external input and internally connected to “0”.

- Input enabled when interrupt function selected and enabled

Inputs are allowed only when the pin is configured as an external interrupt request input pin and the external interrupt request is enabled.

## ■ ELECTRICAL CHARACTERISTICS

### 1. Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage <sup>*1, *2</sup>	V <sub>CC</sub>	V <sub>SS</sub> – 0.3	V <sub>SS</sub> + 4.0	V	
Analog power supply voltage <sup>*1, *3</sup>	A V <sub>CC</sub>	V <sub>SS</sub> – 0.3	V <sub>SS</sub> + 4.0	V	
Analog reference voltage <sup>*1, *3</sup>	A V <sub>RH</sub>	V <sub>SS</sub> – 0.3	V <sub>SS</sub> + 4.0	V	
Input voltage <sup>*1</sup>	V <sub>I</sub>	V <sub>SS</sub> – 0.3	V <sub>CC</sub> + 0.3 (≤ 4.0)	V	*7
		V <sub>SS</sub> – 0.3	V <sub>SS</sub> + 6.0	V	5 V tolerant
Analog pin input voltage <sup>*1</sup>	V <sub>IA</sub>	V <sub>SS</sub> – 0.3	V <sub>SS</sub> + 4.0	V	
Output voltage <sup>*1</sup>	V <sub>O</sub>	V <sub>SS</sub> – 0.3	V <sub>CC</sub> + 0.3	V	
Maximum clamp current	I <sub>CLAMP</sub>	– 4	+ 4	mA	*8
Total maximum clamp current	Σ I <sub>CLAMP</sub>	—	40	mA	*8
“L” level maximum output current <sup>*4</sup>	I <sub>OL</sub>	—	10	mA	
“L” level average output current <sup>*5</sup>	I <sub>OLAV</sub>	—	4	mA	
“L” level total maximum output current	ΣI <sub>OL</sub>	—	100	mA	
“L” level total average output current <sup>*6</sup>	ΣI <sub>OLAV</sub>	—	50	mA	
“H” level maximum output current <sup>*4</sup>	I <sub>OH</sub>	—	– 10	mA	
“H” level average output current <sup>*5</sup>	I <sub>OHAV</sub>	—	– 4	mA	
“H” level total maximum output current	ΣI <sub>OH</sub>	—	– 100	mA	
“H” level total average output current <sup>*6</sup>	ΣI <sub>OHAV</sub>	—	– 50	mA	
Power consumption (Flash product)	P <sub>D</sub>	—	500	mW	
Power consumption (MASK product)		—	350	mW	
Operating temperature	T <sub>a</sub>	– 40	+ 85	°C	
Storage temperature	T <sub>STG</sub>	– 55	+ 125	°C	

\*1 : The parameter is based on V<sub>SS</sub> = A V<sub>SS</sub> = 0.0 V.

\*2 : V<sub>CC</sub> must not drop below V<sub>SS</sub> – 0.3 V.

\*3 : Be careful not to exceed V<sub>CC</sub> + 0.3 V, for example, when the power is turned on.

\*4 : The maximum output current is the peak value for a single pin.

\*5 : The average output is the average current for a single pin over a period of 100 ms.

\*6 : The total average output current is the average current for all pins over a period of 100 ms.

\*7 : If the input current or the maximum input current are limited by some means with external components, the I<sub>CLAMP</sub> rating supersedes the V<sub>I</sub> rating.

# MB91635A Series

(Continued)

- \*8 : • Corresponding pins:P14 to P17,P50 to P57, P60 to P62, P67, PC0 to PC7, PK2, PK3  
• Use within recommended operating conditions.  
• Use at DC voltage (current).  
• The +B signal should always be applied by connecting a limiting resistor between the +B signal and the microcontroller.  
• The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the +B signal is input.  
• Note that when the microcontroller drive current is low, such as in the low power consumption modes, the +B input potential can increase the potential at the V<sub>CC</sub> pin via a protective diode, possibly affecting other devices.  
• Note that if the +B signal is input when the microcontroller is off (not fixed at 0V), since the power is supplied through the pin, the microcontroller may operate incompletely.  
• Do not leave +B input pins open.  
• Sample recommended circuit

•Input/output equivalent circuit

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

## 2. Recommended Operating Conditions

( $V_{SS} = AV_{SS} = 0.0$  V)

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply voltage	$V_{CC}$	2.7	3.6	V	
Analog power supply voltage	$AV_{CC}$	2.7	3.6	V	$AV_{CC} \leq V_{CC}$
Analog reference voltage	$AV_{RH}$	$AV_{SS}$	$AV_{CC}$	V	
Operating temperature	$T_a$	- 40	+ 85	°C	

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

Note: DIVB : Base clock division configuration bit  
 ODS : PLL macro oscillation clock division rate select bit  
 PDS : PLL input clock division select bit  
 PMS : PLL clock multiple rate select bit

## (2) Sub Clock (SBCLK) Input Standard

( $V_{CC} = AV_{CC} = 2.7\text{ V}$  to  $3.6\text{ V}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $T_a = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ )

Parameter	Symbol	Pin name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Input frequency	$F_{CL}$		—	—	32.768	—	kHz	When crystal oscillator is connected
			—	—	32.768	—	kHz	When using external clock
Input clock cycle	$t_{CYLL}$	X0A, X1A	—	—	30.518	—	$\mu\text{s}$	When using external clock
			$P_{WH}/t_{CYLL}$ $P_{WL}/t_{CYLL}$	45	—	55	%	When using external clock
Input clock rise time and fall time	$t_{CF}, t_{CR}$		—	—	—	200	ns	When using external clock

<When external clock input>

### (3) Conditions of PLL

( $V_{CC} = AV_{CC} = 2.7\text{ V to }3.6\text{ V}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $T_a = -40^\circ\text{C to }+85^\circ\text{C}$ )

Parameter	Symbol	Conditions	Value			Unit	Remarks
			Min	Typ	Max		
PLL oscillation stabilization wait time (LOCK UP time)	$t_{LOCK}$	—	600	—	—	μs	Time from when the PLL starts operating until the oscillation stabilizes
PLL input clock frequency	$f_{PLLI}$	—	4	—	24	MHz	
PLL multiple rate	—	—	4	—	30	multiplied by	ODS × PMS
PLL macro oscillation clock frequency	$f_{PLLO}$	—	80	—	120	MHz	

### (4) Regulator Voltage Stabilization Wait Time

( $V_{CC} = AV_{CC} = 2.7\text{ V to }3.6\text{ V}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $T_a = -40^\circ\text{C to }+85^\circ\text{C}$ )

Parameter	Symbol	Conditions	Value		Unit	Remarks
			Min	Max		
Regulator voltage stabilization wait time	$t_{REG}$	—	50	—	μs	Time taken for the regulator voltage to stabilize

Note : This is the time from when the external power supply stabilizes (after reaching 2.7 V).

### (5) Reset Input Standards

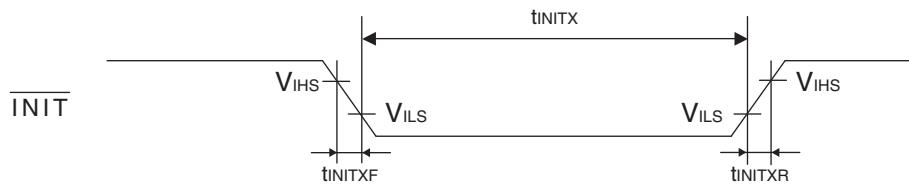

( $V_{CC} = AV_{CC} = 2.7\text{ V to }3.6\text{ V}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $T_a = -40^\circ\text{C to }+85^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condi-tions	Value		Unit	Remarks
				Min	Max		
Reset input time (At power-on, main oscillation stop mode)	$t_{INITX}$	$\overline{INIT}$	—	Oscillation time of oscillator + 10 $t_{CYLH}$	—	ns	*
Reset input time (At other times)				10 $t_{CYLH}$	—	ns	
Reset input rise time and fall time	$t_{INITXF}, t_{INITXR}$			—	10	ms	

\* : After the supply voltage has stabilized, it takes a further 50 μs until the internal supply stabilizes. Hold the input to the  $\overline{INIT}$  pin during that period.

- At power-on
- When in stop mode
- When in sub mode and sub watch mode when the main oscillation is stopped.

“(Repeated) START condition” hold time SDA ↓ → SCL ↓	t <sub>HDDSTA</sub>	SOUT <sub>n</sub> (SDA <sub>n</sub> ), SCK <sub>n</sub> (SCL <sub>n</sub> )		4.0	—	0.6	—	μs
SCL clock “L” width	t <sub>LOW</sub>	SCK <sub>n</sub> (SCL <sub>n</sub> )		4.7	—	1.3	—	μs
SCL clock “H” width	t <sub>HIGH</sub>	SCK <sub>n</sub> (SCL <sub>n</sub> )		4.0	—	0.6	—	μs
“Repeated START condition” setup time SCL ↑ → SDA ↓	t <sub>SUSTA</sub>	SCK <sub>n</sub> (SCL <sub>n</sub> )		4.7	—	0.6	—	μs
Data hold time SCL ↓ → SDA ↓ ↑	t <sub>HDDAT</sub>	SOUT <sub>n</sub> (SDA <sub>n</sub> ), SCK <sub>n</sub> (SCL <sub>n</sub> )		0	3.45 <sup>*2</sup>	0	0.9 <sup>*3</sup>	μs
Data setup time SDA ↓ ↑ → SCL ↑	t <sub>SUDAT</sub>	SOUT <sub>n</sub> (SDA <sub>n</sub> ), SCK <sub>n</sub> (SCL <sub>n</sub> )		250	—	100	—	ns
“STOP condition” setup time SCL↑ → SDA↑	t <sub>SUSTO</sub>	SOUT <sub>n</sub> (SDA <sub>n</sub> ), SCK <sub>n</sub> (SCL <sub>n</sub> )		4.0	—	0.6	—	μs
Bus free time between “STOP condition” and “START condition”	t <sub>BUF</sub>	—		4.7	—	1.3	—	μs
Noise filter	t <sub>SP</sub>	—	—	2t <sub>CYCP</sub> <sup>*4</sup>	—	2t <sub>CYCP</sub> <sup>*4</sup>	—	ns

\*1 : R and C represent the pull-up resistance and load capacitance of the SCL and SDA lines, respectively. V<sub>p</sub> indicates the power supply voltage of the pull-up resistance and I<sub>OL</sub> indicates V<sub>OL</sub> guaranteed current.

\*2 : The maximum t<sub>HDDAT</sub> must satisfy that it doesn't extend at least “L” period (t<sub>LOW</sub>) of device's SCL signal.

\*3 : A high-speed mode I<sup>2</sup>C bus device can be used on a standard mode I<sup>2</sup>C bus system as long as the device satisfies the requirement of “t<sub>SUDAT</sub> ≥ 250 ns”.

\*4 : t<sub>CYCP</sub> is the peripheral clock cycle time. To use I<sup>2</sup>C, set the peripheral bus clock at 8 MHz or more.

# MB91635A Series

## 5. Electrical Characteristics for the A/D Converter

( $V_{cc} = AV_{cc} = 2.7\text{ V}$  to  $3.6\text{ V}$ ,  $V_{ss} = AV_{ss} = 0\text{ V}$ ,  $T_a = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ )

Parameter	Pin name	Value			Unit	Remarks
		Min	Typ	Max		
Resolution	—	—	—	10	bit	
Total error	—	- 5.0	—	+ 5.0	LSB	
Linearity error	—	- 3.5	—	+ 3.5	LSB	
Differential linearity error	—	- 3	—	+ 3	LSB	
Zero transition voltage	AN0 to AN30	- 1.5	+ 0.5	+ 4	LSB	$AV_{cc} = 3.3\text{ V}$ , $AV_{RH} = 3.3\text{ V}$
Full transition voltage	AN0 to AN30	$AV_{RH} - 4$	$AV_{RH} - 1.5$	$AV_{RH} + 0.5$	LSB	
Compare time	—	0.72 <sup>*3</sup>	—	—	μs	PCLK = 33 MHz
Conversion time	—	1.2 <sup>*1</sup>	—	—	μs	PCLK = 33 MHz
Power supply current (analog + digital)	$AV_{cc}$	—	—	7	mA	When operating 2 A/D units (with D/A stopped)
		—	—	11	μA	At power-down <sup>*2</sup>
Reference power supply current (between $AV_{RH}$ and $AV_{ss}$ )	$AV_{RH}$	—	—	1.2	mA	When operating 2 A/D units $AV_{RH} = 3.0\text{ V}$
		—	—	5	μA	At power-down <sup>*2</sup>
Analog input capacitance	—	—	—	8.5	pF	
Interchannel disparity	—	—	—	4	LSB	
Analog port input current	AN0 to AN30	—	—	10	μA	
Analog input voltage	AN0 to AN30	$AV_{ss}$	—	$AV_{RH}$	V	
Reference voltage	$AV_{RH}$	$AV_{ss}$	—	$AV_{cc}$	V	

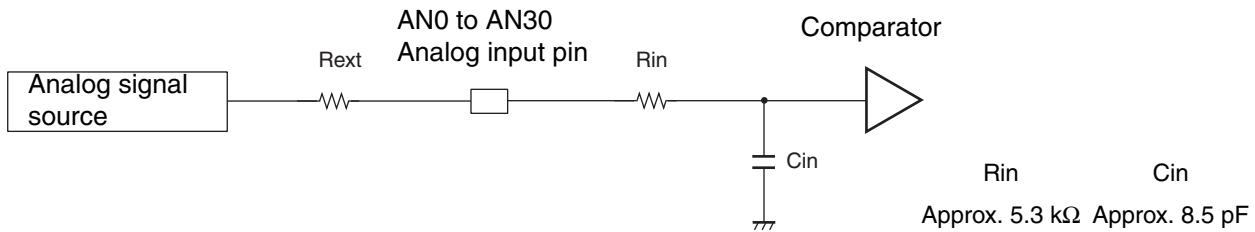

\*1 : It depends on the actual external load and the clock cycle supplied to peripheral resources. Make sure to satisfy PCLK cycle  $\times$  4 or over + below (Equation 1). The condition of minimum conversion time is the value when PCLK = 33 MHz, sampling time: 0.424 μs, external impedance: 1.4k Ω or below, compare time: 0.72 μs.

\*2 : The current when the CPU is in stop mode and the A/D converter is not operating.

\*3 : Compare time =  $\{(CT + 1) \times 10 + 4\} \times$  peripheral clock (PCLK) period. (CT indicates compare time setting bits.) The condition of the minimum compare time is when CT = 1 and PCLK = 33 MHz.

(Continued)

(Continued)

The output impedance of the external circuit connected to the analog input affects the sampling time of the A/D converter. Design the output impedance of the output circuit such that the required sampling time is less than the value of  $T_s$  calculated from the following equation.

- (Equation1)  $T_s = (Rin + Rext) \times Cin \times 8$
- $T_s$  : Sampling time
  - $Rin$  : Input resistance of A/D = 5.3 kΩ
  - $Cin$  : Input capacitance of A/D = 8.5 pF
  - $Rext$  : Output impedance of external circuit

If the sampling time is set as 600 ns,

$$600 \text{ ns} \geq (5.3 \text{ k}\Omega + Rext) \times 8.5 \text{ pF} \times 8$$

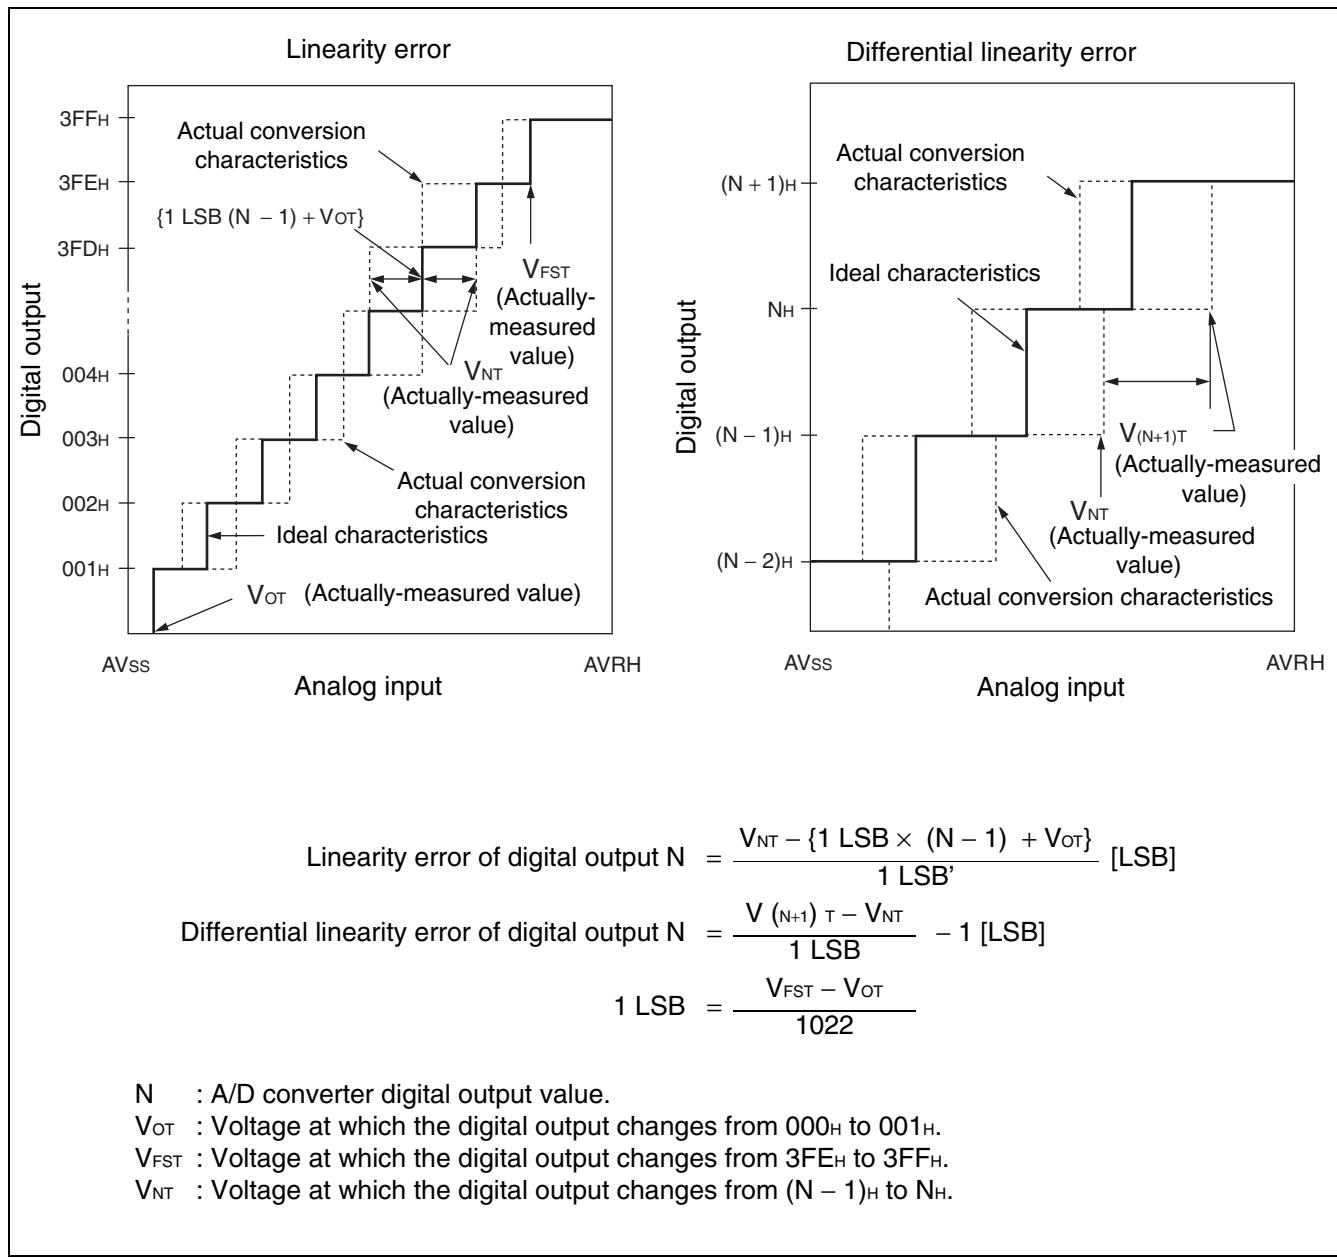

$$\therefore Rext \leq 3.5 \text{ k}\Omega$$

And the impedance of the external circuit therefore needs to be 3.5 kΩ or less.

# MB91635A Series

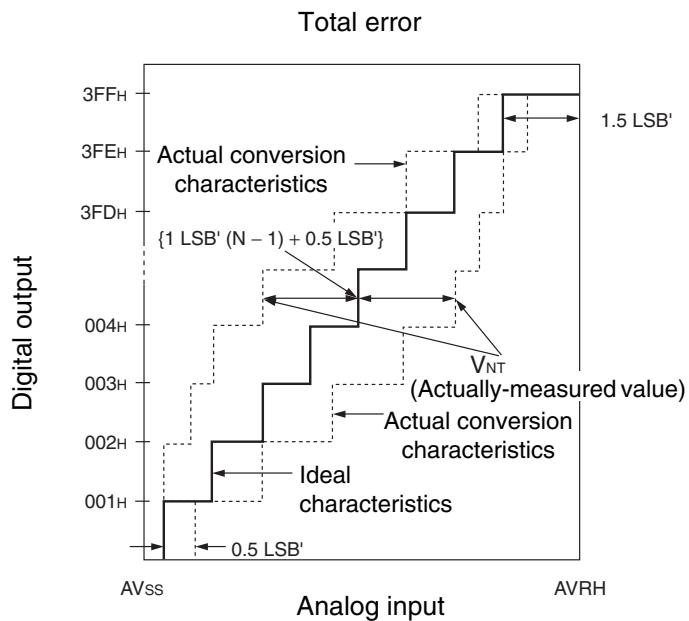

## •Definition of 10-bit A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Linearity error : Deviation of the line between the zero-transition point ( $0000000000 \leftarrow \rightarrow 0000000001$ ) and the full-scale transition point ( $1111111110 \leftarrow \rightarrow 1111111111$ ) from the actual conversion characteristics.
- Differential linearity error : Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.
- Total error : Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error, and linear error.

(Continued)

(Continued)

$$1 \text{ LSB}' (\text{Ideal value}) = \frac{\text{AVRH} - \text{AV}_{\text{ss}}}{1024} [\text{V}]$$

$$\text{Total error of digital output } N = \frac{V_{\text{NT}} - \{1 \text{ LSB}' \times (N - 1) + 0.5 \text{ LSB}'\}}{1 \text{ LSB}'} [\text{V}]$$

N : A/D converter digital output value.

$V_{\text{NT}}$  : Voltage at which the digital output changes from  $(N + 1)_H$  to  $N_H$ .

$V_{\text{OT}}'$  (Ideal value) =  $\text{AV}_{\text{ss}} + 0.5 \text{ LSB}$  [V]

$V_{\text{FST}}'$  (Ideal value) =  $\text{AVRH} - 1.5 \text{ LSB}$  [V]

# MB91635A Series

## 6. Electrical Characteristics for the D/A Converter

( $V_{CC} = AV_{CC} = 2.7\text{ V}$  to  $3.6\text{ V}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $T_a = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ )

Parameter	Pin name	Value			Unit	Remarks
		Min	Typ	Max		
Resolution	—	—	—	8	bit	
Linearity error	—	-2.0	—	+2.0	LSB	When the output is unloaded
Differential linearity error	—	-1.0	—	+1.0	LSB	When the output is unloaded
Conversion time	—	—	0.6	—	μs	When load capacitance ( $C_L$ ) = 20 pF
	—	—	3.0	—	μs	When load capacitance ( $C_L$ ) = 100 pF
Analog output impedance	DA0 to DA2	3.19	3.51	5.85	kΩ	
Analog current	AV <sub>CC</sub>	—	450	—	μA	10 μs conversion, when the output is unloaded (When 3 channels operating, A/D stopped)
		—	—	3600*	μA	When the input digital code is fixed at 7A <sub>H</sub> or 85 <sub>H</sub> (When 3 channels operating, A/D stopped)
		—	—	11	μA	At power-down (When A/D stopped)

\* : The current consumption of the D/A converter varies with input digital code. The standard value indicates the current consumed when the digital code that maximizes the current consumption is input.

## 7. Flash Memory Write/Erase Characteristics

(V<sub>CC</sub> = 3.3 V, Ta = + 25 °C)

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time	—	0.5	2.0	s	Excludes write time prior to internal erase
Half word (16 bits) write time	—	6	100	μs	Not including system-level overhead time.
Chip erase time <sup>*1</sup>	—	12	48	s	Excludes write time prior to internal erase (When equipped with 1 Mbyte)
	—	8	32		Excludes write time prior to internal erase (When equipped with 512 Kbytes)
Erase/write cycles	10000	—	—	cycle	Average Ta ≤ + 85 °C
Flash memory data hold time	10 <sup>*2</sup>	—	—	year	Average Ta ≤ + 85 °C

\*1: The chip erase time is the sector erase time multiplied across all sectors.

\*2: This value comes from the technology qualification (using Arrhenius equation to translate high temperature measurements into normalized value at + 85 °C) .

## ■ MAIN CHANGES IN THIS EDITION

Page	Section	Change Results
—	—	Added MB91F635A and MB91637A.
14	■ PIN DESCRIPTION	Corrected "I/O circuit Type" of the pins number 31/K2, 32/K3 and 33/L1. (P → H, P)
40	■ I/O CIRCUIT TYPE	Added the type H.
48	■ HANDLING DEVICES	Added "• Differences in features among the products with different memory sizes and between Flash products and MASK products".
49	■ BLOCK DIAGRAM	Added "/Mask ROM" to "Built-in program memory Flash memory".
93	■ ELECTRICAL CHARACTERISTICS 1. Absolute Maximum Ratings	Changed from "Power consumption" to "Power consumption (Flash product)". Added "Power consumption (MASK product)".
96	3. DC Characteristics	Added "Power supply current (MASK product)".

The vertical lines marked in the left side of the page show the changes.

### All Rights Reserved.

The contents of this document are subject to change without notice.

Customers are advised to consult with sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of FUJITSU SEMICONDUCTOR device; FUJITSU SEMICONDUCTOR does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information.

FUJITSU SEMICONDUCTOR assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of FUJITSU SEMICONDUCTOR or any third party or does FUJITSU SEMICONDUCTOR warrant non-infringement of any third-party's intellectual property right or other right by using such information. FUJITSU SEMICONDUCTOR assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that FUJITSU SEMICONDUCTOR will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Exportation/release of any products described in this document may require necessary procedures in accordance with the regulations of the Foreign Exchange and Foreign Trade Control Law of Japan and/or US export control laws.
